# Error

```
raise gradio.Error("An error occurred 💥!", duration=5)
```

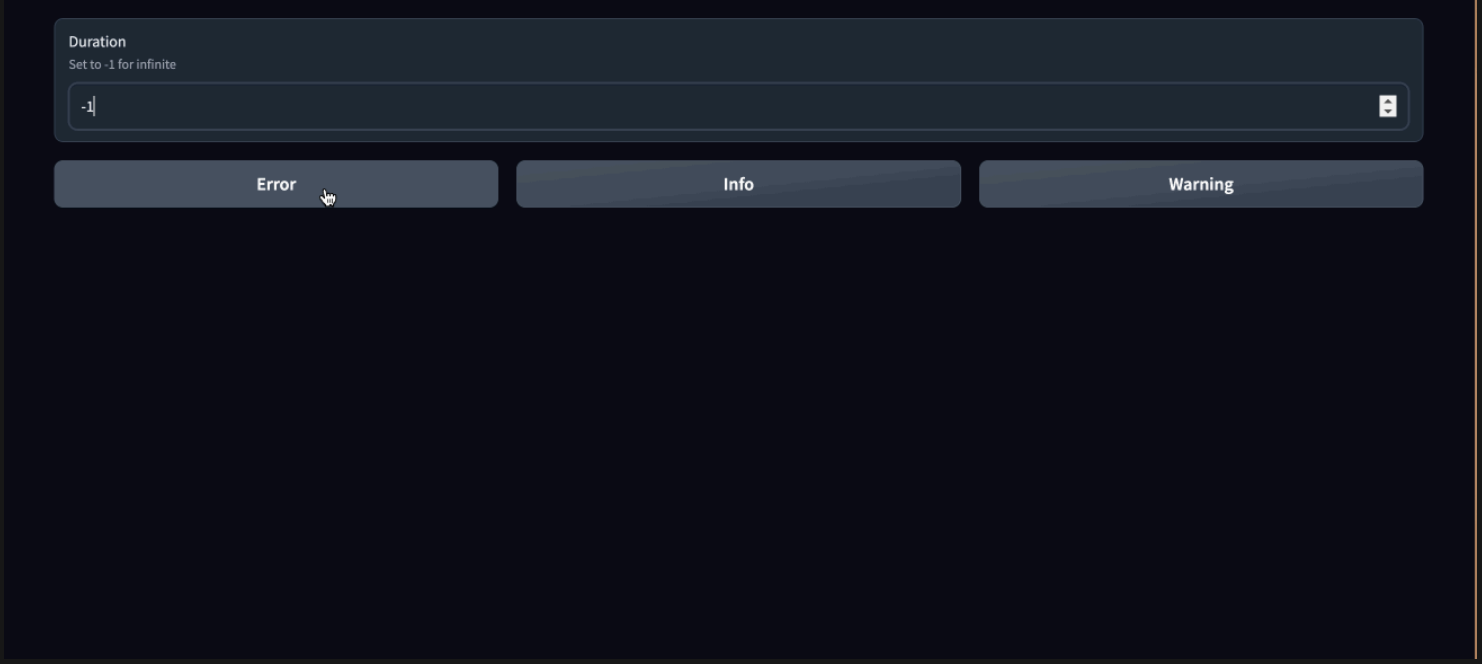
## Description

This class allows you to pass custom error messages to the user. You can do so by raising a gr.Error("custom message") anywhere in the code, and when that line is executed the custom message will appear in a modal on the demo.

You can control for how long the error message is displayed with the `duration` parameter. If it's `None`, the message will be displayed forever until the user closes it. If it's a number, it will be shown for that many seconds.

You can also hide the error modal from being shown in the UI by setting `visible=False`.

Below is a demo of how different values of duration control the error, info, and warning messages. You can see the code here.



## Example Usage

```
import gradio as gr
def divide(numerator, denominator):
    if denominator == 0:
        raise gr.Error("Cannot divide by zero!")
gr.Interface(divide, ["number", "number"], "number").launch()
```

## Initialization

**Parameters**

- `message: str`
- `duration: float | None`
- `visible: bool`
- `title: str`
- `print_exception: bool`
